

AlereDataLink

The reporting and information website of Alere Toxicology Services, Inc. - www.AlereDataLink.com - links you with your drug screen data and enables you to more efficiently and effectively manage your own substance abuse testing program.

Current features of AlereDataLink are:

- viewing news about Alere and new features of AlereDataLink
- searching for drug screens received at Alere
- viewing and printing drug screen result reports
- viewing and printing scanned images of initial and certified chain of custody forms
- listing facilities linked to a particular account
- downloading results in an ASCII file or XML file format by date range
- printing a set of results by date range
- generating statistical reports
- ordering supplies
- generating random lists for random drug test programs
- searching for and viewing collection site information from our database, including the site's address and a map

Through a secure website available 24 hours a day, 7 days a week, AlereDataLink allows you to retrieve new results, view old results, and identify those specimens in progress. The system allows access to and sorting of drug screens by date, donor name, social security number, specimen ID number, and facility. You may then print drug test result reports and chain of custody forms and list tests that have been received as well as those that are pending.

In addition to its viewing and printing capabilities, AlereDataLink allows users to perform file transfers that may easily be incorporated into a database to help manage and integrate drug screen records with existing information files. The user can download the results in a comma-delimited or XML format that can be imported later on the user's end, saving the time used to re-enter results.

AlereDataLink also has an email notification option that clients can use to receive a message when test results are completed. We are unable to email the actual test results for security reasons; however, we can notify clients when test results are completed and posted to the website. Once an hour, the system will compile an email message of those results available through AlereDataLink. This email message will then be sent to an email address with a list of the results available, including the donor demographic information and specimen identification number. Then, the user can go to the website, log in, and retrieve his/her results at his/her convenience. To ensure users will not be overloaded with emails, the system will not repeat messages. Once an hour, a single message for a result or group of results is sent when those results are completed.
